I know the difference between GPU and CPU but can anybody explain it simply? I want to know what is the difference between GPU and CPU? A: GPU is a co-processor chip for graphical rendering. It's not just for rendering, but also to accelerate any algorithm which involves drawing (including many algorithms for video compression, gaming etc). CPU is processor for general-purpose computing. It's also used for image processing, but in a different way from GPU. A: CPU is a microprocessor. On your computer it is the part between your main memory and your RAM (Random Access Memory). GPU is a graphics card. It is a specialized part for rendering graphics. A: CPU is the main processor of a computer. It usually has an integrated memory, called (shared) RAM. CPUs work on the concept of instructions, and it is their function to take a piece of code in memory, and execute that code on the CPU's "micro" level. GPU is a graphics card, and it's job is to take the computer's discrete GPU, and do a LOT of processing on the graphics chip's macro level, meaning you can do computations across the large chips on the graphics card, and that they can be outputted to the screen as image data. GPU also has some memory inside, called (dedicated) RAM. However the GPU memory is small, so it gets used as a cache for speeding up the computations on the GPU. RAM gets used as a cache for the GPU. GPU operations are relatively quick, and often the graphics card's RAM already has data in it from previous operations, so when a graphics operation has to be performed, it looks at that data, and if that's not there, it can quickly make a new copy from RAM if it's not there, and if it is, it can quickly retrieve the data from the GPU's memory, and do the operation. CPUs don't have a RAM, and their programs live in (shared) RAM. Instead of CPU RAM being a 'cache', it 1cb139a0ed
